Claims

1. An apparatus for in situ monitoring of molten polymer and/or oligomer composition comprising:

a light source;

- a fiber optic transmission probe, wherein said probe transmits at least one substantially monochromatic radiation from said light source to irradiate a sample comprising at least one polymer and/or oligomer and collects light transmitted from said irradiated sample;
- a spectrophotometer, wherein said spectrophotometer monitors radiation comprising UV/visible light absorbed by said irradiated sample; and a data analysis system, wherein said data analysis system correlates absorbance to at least one predetermined reaction component.

Hard the first the free man the first that [c2] 2. The apparatus of claim 1, wherein said probe is maintained at a substantially constant temperature.

[c3]

3. The apparatus of claim 1, wherein said probe comprises a high temperature probe.

The state of the s [c4] 4. The apparatus of claim 3, wherein said probe is immersed in the polymer sample.

[c5]

5. The apparatus of claim 3, wherein said probe operates at a temperature in the range from 200 $^{\rm o}$ C to 400 $^{\rm o}$ C.

[c6]

6. The apparatus of claim 3, wherein said probe operates at a temperature in the range from 250 $^{\rm o}$ C to 350 $^{\rm o}$ C.

[c7]

7. The apparatus of claim 3, wherein said probe operates at a temperature in the range from 260 $^{\rm o}$ C to 330 $^{\rm o}$ C.

[c8]

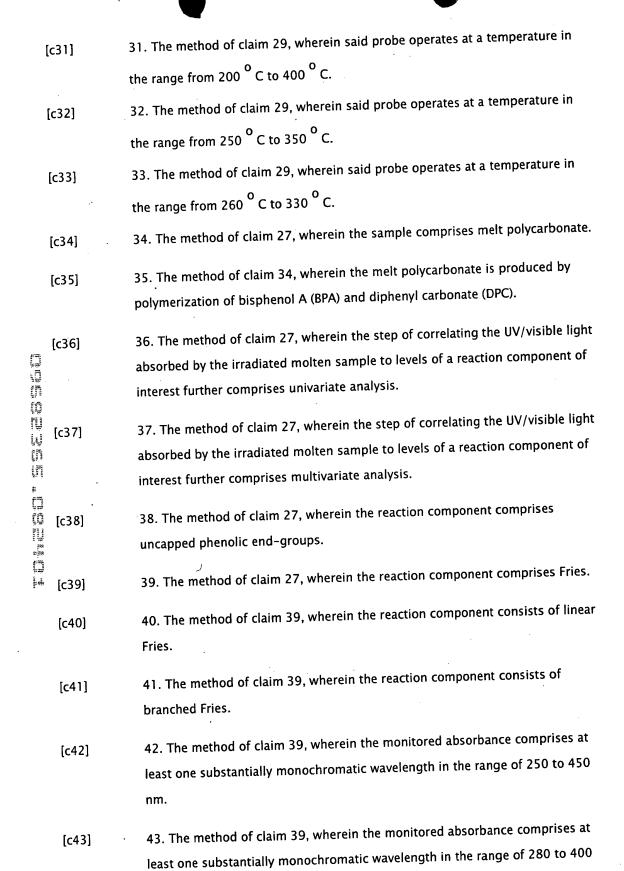

8. The apparatus of claim 1, further comprising a filter positioned between said light source and said spectrophotometer.

[c9]

9. The apparatus of claim 1, wherein said data analysis system comprises univariate analysis.

|-------|---|
| [c10] | 10. The apparatus of claim 1, wherein said data analysis system comprises multivariate analysis. |
| [c11] | 11. The apparatus of claim 1, wherein said sample comprising at least one polymer and/or oligomer comprises molten polycarbonate. |
| [c12] | 12. The apparatus of claim 11, wherein said polycarbonate comprises melt polycarbonate. |
| [c13] | 13. The apparatus of claim 12, wherein said melt polycarbonate is produced by polymerization of bisphenol A (BPA) and diphenyl carbonate (DPC). |
| [c14] | 14. The apparatus of claim 1, wherein said reaction component comprises uncapped phenolic end-groups. |
| (c15) | 15. The apparatus of claim 1, wherein said reaction component comprises Fries products. |
| [c15] | 16. The apparatus of claim 15, wherein said Fries rearrangement products consist of linear Fries products. |
| (c17] | 17. The apparatus of claim 15, wherein said Fries rearrangement products consist of branched Fries products. |
| C18] | 18. The apparatus of claim 15, wherein said monitored absorbance comprises at least one substantially monochromatic wavelength in the range of 250 to 450 nm. |
| [c19] | 19. The apparatus of claim 15, wherein said monitored absorbance comprises at least one substantially monochromatic wavelength in the range of 280 to 400 nm. |
| [c20] | 20. The apparatus of claim 15, wherein said monitored absorbance comprises at least one substantially monochromatic wavelength in the range of 290 to 330 nm. |
| [c21] | 21. The apparatus of claim 15, wherein said monitored absorbance comprises a wavelength of about 320 nm. |

| [c22] | 22. The apparatus of claim 1, wherein said monitored absorbance is correlated to predetermined reaction components comprising Fries products and uncapped phenolic end-groups. |
|--|---|
| [c23] | 23. The apparatus of claim 22, wherein said monitored absorbance comprises at least two substantially monochromatic wavelengths in the range of 250 to 450 nm. |
| [c24] | 24. The apparatus of claim 22, wherein said monitored absorbance comprises at least two substantially monochromatic wavelengths in the range of 260 to 400 nm. |
| [c25] | 25. The apparatus of claim 22, wherein said monitored absorbance comprises at least two substantially monochromatic wavelengths in the range of 270 to 340 nm. |
| | 26. Computer readable media comprising software code for the apparatus of claim 1. |
| Afficiant from [c27] The stands with first from the stands with the stands wi | 27. A method for <i>in situ</i> monitoring of molten polymer and/or oligomer composition comprising: providing an optical contact between a fiber optic probe and a stream of a molten sample comprising at least one polymer and/or oligomer; irradiating the molten sample with at least one wavelength of substantially monochromatic radiation, monitoring UV/visible light adsorbed by the molten sample; and correlating the UV/visible light absorbed by the irradiated molten sample to levels of at least one reaction component of interest. |
| [c28] | 28. The method of claim 27, wherein the probe is maintained at a substantially constant temperature. |
| [c29] | 29. The method of claim 27, further comprising using a high temperature probe for irradiating the polymer and collecting light transmitted from the polymer. |
| [c30] | 30. The method of claim 29, wherein the probe is immersed directly in the polymer sample. |

nm.

| | [c44] | 44. The method of claim 39, wherein the monitored absorbance comprises at least one substantially monochromatic wavelength in the range of 290 to 330 nm. |
|--|-------|---|
| Here Hand the transfer over the state of the transfer over the state of the state o | [c45] | 45. The method of claim 39, wherein the monitored absorbance comprises a wavelength of about 320 nm. |
| | [c46] | 46. The method of claim 27, wherein the monitored absorbance is correlated to reaction components comprising Fries products and uncapped phenolic endgroups. |
| | [c47] | 47. The method of claim 46, wherein the monitored absorbance comprises at least two substantially monochromatic wavelengths in the range of 250 to 450 nm. |
| | [c48] | 48. The method of claim 46, wherein the monitored absorbance comprises at least two substantially monochromatic wavelengths in the range of 260 to 400 nm. |
| | [c49] | 49. The method of claim 46, wherein the monitored absorbance comprises at least two substantially monochromatic wavelengths in the range of 270 to 340 nm. |
| | [c50] | 50. The method of claim 27, wherein the reaction component of interest is measured during production of the polymer. |
| | [c51] | 51. The method of claim 27, wherein irradiation and monitoring of light absorbed is performed on combinatorial libraries of samples. |
| 53 | [c52] | 52. The method of claim 27, further comprising applying a predetermined selection test to determine whether any one of a set of preselected reaction components needs to be adjusted. |
| | [c53] | 53. Computer readable media comprising software code for performing the method of claim 24. |

[c54] 54. A method for real time monitoring of molten polycarbonate composition during production comprising:

positioning an optical probe in optical contact with a stream of molten sample comprising at least one polymer and/or oligomer such that the probe maintains a substantially constant temperature; irradiating the molten sample with at least one wavelength of

irradiating the molten sample with at least one wavelength of substantially monochromatic radiation;

monitoring UV/visible light absorbed by the irradiated sample; and correlating the light absorbed by the irradiated sample to levels of Fries products.

55. A method for real time monitoring of molten polycarbonate composition during production comprising:

positioning an optical probe in optical contact with a stream of molten sample comprising at least one polymer and/or oligomer, such that the probe comprises a substantially constant temperature;

irradiating the molten sample with at least two wavelengths of substantially monochromatic radiation;

monitoring UV/visible light absorbed by the irradiated sample; and correlating the light absorbed by the irradiated sample to levels of Fries products and phenolic end-groups.

56. A method for real time monitoring of molten polycarbonate composition during production comprising:

positioning an optical probe in optical contact with a stream of molten sample comprising at least one polymer and/or oligomer, such that the probe comprises a substantially constant temperature;

irradiating the molten sample with at least three wavelengths of substantially monochromatic radiation;

monitoring UV/visible light absorbed by the irradiated sample; and correlating the light absorbed by the irradiated sample to levels of linear Fries products, branched Fries products, and phenolic end-groups.
